KROPOTKIN

My dear Kellie

Thanks for the Bulletin and the Russian pamphlets. They are very interesting and I will send you notes thereupon.

Many thanks also for the Pictorial and Graphic. You hardly could imagine the pleasure I have to receive them, to look the pictures, and to search for information about what is going on in our world. An English illustrated paper gives more news than any French review.

I send to-day by book-post a copy of a paper of mine appeared in the Revue Scientifique of last Saturday, about the

Do not forget me to Mary with Barrington and.

I had interrupted my work as my wife came here, and took a fortnight holidays which were most necessary on account of the health. It is not well at all: gastralgy, and consequently nervosy are all the time pursuing me.

I have now a new work to do for the Hachette. After I have revised their new (very good) map of Russia, for Vivien St Martin's atlas, Elisée Reclus has asked me to revise, for a new edition, his 5th volume, containing Scandinavia, Finland, & Russia in Europe. So I have plenty of work, not to speak of the Encyclopaedia with which I only keep the peace for not making grudge too much the printer.

How are you, dear friend? Are you well? and Lizzie? Did she receive my scholar-painting of roses?

With heartiest wishes

Yours sincerely
P Kropotkine

Enclosed a note for Nature

DSI

plasticity. I address this one of the very few copies I have to Mr. Lockyer. I have tried to rehabilitate the memory of James Forbes against the not too fair attacks of Tyndall, and to apply to the problem of the motion of glaciers the results of Tresca's researches into what he has so well-called the "flowing of solids". They bring us back to Forbes's hypothesis.

I am rather severe at more than one place against Tyndall; but I never could consider otherwise than as a humbug his "calculations" (a mere repetition of Hopkins's ones, carried on much farther than ever Hopkins would admit) to prove the incapacity of ice to support extension, — not to say that all the explanation of viscosity as a property of yielding to extension shows very little knowledge both of the terminology used at that time, and of the mechanical conditions of the problem. I send him a copy of the paper and I suppose he will not be pleased at all to see his calculations dealt with with so little respect. — He was unfair with regard to Forbes.

I regret it could not be published in English: it would have been much too long for Nature: in the Revue Scientifique it takes 20½ columns. Richet (the physiologist who is at the head of the paper) has preferred to publish it in one number, instead of dividing into two papers as I proposed.

In a very few days I will send you various things for Nature

Viola. Bromley. Kent
December 30. 1897

Dear Professor Thomson

Thank you so very much for your kind remembrance of me. Your beautiful card, with the most poetic spot of the beautiful scenery which we saw last Summer, has at once transported me in imagination to the grand mountain scenery and to the charming days

was spent in Canada
and at Niagara, and to
the little, too little bit
of acquaintance which
we made during that
last journey and after-
wards.

Kindly give to
Mrs Thompson and mine
yourself my very best
and hearty good wishes
of a bright and happy
New Year and believe me

Yours Sincerely

P. Kropotkin

If your heart beats in unison
with that of humanity; if,
like a true poet, you have an
ear for the heartbeat of life
you will not remain neuter;
you will range yourself on the
side of the oppressed
